## CHE680

## Advanced Analytical Chemistry Lecture 2

Jamie Kim
Department of Chemistry Buffalo State College

## Question 1

Can you make it? How?
Which tool(s) do you need?
$98 \% \mathrm{H}_{2} \mathrm{SO}_{4}$

$1.0 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$

## SI -Derived Units

## Table 1-2 SI-derived units with special names

| Quantity | Unit | Symbol | Expression in <br> terms of <br> other units | Expression in <br> terms of SI <br> base units |
| :--- | :--- | :--- | :--- | :--- |
| Frequency | hertz | Hz |  | $1 / \mathrm{s}$ |
| Force | newton | N |  | $\mathrm{m} \cdot \mathrm{kg} / \mathrm{s}^{2}$ |
| Pressure | pascal | Pa | $\mathrm{N} / \mathrm{m}^{2}$ | $\mathrm{~kg} /\left(\mathrm{m} \cdot \mathrm{s}^{2}\right)$ |
| Energy, work, quantity of heat | joule | J | $\mathrm{N} \cdot \mathrm{m}$ | $\mathrm{m} \cdot \mathrm{kg} / \mathrm{s}^{2}$ |
| Power, radiant flux | watt | W | $\mathrm{J} / \mathrm{s}$ | $\mathrm{m} \cdot \mathrm{kg} / \mathrm{s}^{3}$ |
| Quantity of electricity, electric charge | coulomb | C |  | $\mathrm{s} \cdot \mathrm{A}$ |
| Electric potential, potential difference, electromotive force | volt | V | $\mathrm{W} / \mathrm{A}$ | $\mathrm{m} \cdot \mathrm{kg} /\left(\mathrm{s}^{3} \cdot \mathrm{~A}\right)$ |
| Electric resistance | ohm | $\Omega$ | $\mathrm{V} / \mathrm{A}$ | m |
| Electric capacitance | farad | F | $\mathrm{C} / \mathrm{V}$ | $\mathrm{m}^{2} \cdot \mathrm{~kg} /\left(\mathrm{s}^{3} \cdot \mathrm{~A}^{2}\right)$ |

speed (v) = distance/time $=\mathrm{m} / \mathrm{s}$ acceleration (a): [speed change]/time $=[\mathrm{m} / \mathrm{s}] / \mathrm{s}=\mathrm{m} / \mathrm{s}^{2}$ force $(F)=($ mass $) \cdot($ acceleration $)=\mathrm{kg} \cdot \mathrm{m} / \mathrm{s}^{2}$ pressure $(\mathrm{P})=($ force $) /($ area $)=\left(\mathrm{kg} \bullet \mathrm{m} / \mathrm{s}^{2}\right) / \mathrm{m}^{2}=\mathrm{kg} /\left(\mathrm{m} \bullet \mathrm{s}^{2}\right)$ work $(W)=($ force $) \cdot($ distance $)=\left(\mathrm{kg} \cdot \mathrm{m} / \mathrm{s}^{2}\right) \cdot \mathrm{m}=\mathrm{kg} \cdot \mathrm{m}^{2} / \mathrm{s}^{2}$

## Prefixes

Table 1-3 Prefixes

| Prefix | Symbol | Factor | Prefix | Symbol | Factor |
| :--- | :--- | :--- | :--- | :--- | :--- |
| yotta | Y | $10^{24}$ | $10^{21}$ | deci | d |
| zetta | Z | $10^{18}$ | centi | c | $10^{-1}$ |
| exa | E | milli | m | $10^{-2}$ |  |
| peta | P | $10^{15}$ | micro | $\mu$ | $10^{-3}$ |
| tera | T | $10^{12}$ | nano | n | $10^{-6}$ |
| giga | G | $10^{9}$ | pico | p | $10^{-9}$ |
| mega | M | $10^{6}$ | femto | f | $10^{-12}$ |
| kilo | k | $10^{3}$ | atto | a | $10^{-15}$ |
| hecto | h | $10^{2}$ | zepto | z | $10^{-18}$ |
| deka | da | $10^{1}$ | yocto | y | $10^{-21}$ |

$1 \AA=10^{-8} \mathrm{~cm}=10^{-10} \mathrm{~m}=10^{-1} \mathrm{~nm}$
Hydrogen atom $r=0.52 \AA=5.2 \times 10^{-11} \mathrm{~m}$

## Unit Conversion

Table 1-4 Conversion factors

| Quantity | Unit | Symbol | SI equivalent ${ }^{a}$ |
| :---: | :---: | :---: | :---: |
| Volume | liter | L | * $10^{-3} \mathrm{~m}^{3}$ |
|  | milliliter | mL | * $10^{-6} \mathrm{~m}^{3}$ |
| Length | angstrom | Å | * $10^{-10} \mathrm{~m}$ |
|  | inch | in. | *0.025 4 m |
| Mass | pound | lb | *0.453 59237 kg |
|  | metric ton |  | *1000 kg |
| Force | dyne | dyn | * $10^{-5} \mathrm{~N}$ |
| Pressure | bar | bar | * $10^{5} \mathrm{~Pa}$ |
|  | atmosphere | atm | *101 325 Pa |
| Energy | torr ( $=1 \mathrm{~mm} \mathrm{Hg}$ ) | Torr | 133.322 Pa |
|  | pound/in. ${ }^{2}$ | psi | 6894.76 Pa |
|  | erg | erg | * $10^{-7} \mathrm{~J}$ |
|  | electron volt | eV | $1.602176462 \times 10^{-19} \mathrm{~J}$ |
|  | calorie, thermochemical | cal | *4.184 J |
|  | Calorie (with a capital C) | Cal | * $1000 \mathrm{cal}=4.184 \mathrm{~kJ}$ |
|  | British thermal unit | Btu | 1055.06 J |
| Power | horsepower |  | 745.700 W |
| Temperature | centigrade (= Celsius) | ${ }^{\circ} \mathrm{C}$ | *K - 273.15 |
|  | Fahrenheit | ${ }^{\circ} \mathrm{F}$ | *1.8(K - 273.15) +32 |

a. An asterisk $(*)$ indicates that the conversion is exact (by definition).

## Density vs. Specific Gravity

## Density = mass/volume (unit: kg/L or $\left.\mathrm{g} / \mathrm{mL}=\mathrm{g} / \mathrm{cm}^{3}=\mathrm{kg} / \mathrm{dm}^{3}=\mathrm{kg} / \mathrm{L}\right)$

Density of water @ $4{ }^{\circ} \mathrm{C}=1.0 \mathrm{~g} / \mathrm{mL}$
Specific gravity = (density)/(density of water @ $4{ }^{\circ} \mathrm{C}$ ), dimensionless

# Targets of Quantitative Chemical Analysis 

- Concentration of target compound?
- Total target amount in the sample?

## Concentration:

Weight-to-weight (w/w, \%, ppm, ppb)
Weight-to-volume (w/v, \%)
Volume to volume (v/v, \%)
Number-to-volume (molarity, M)

## percent (\%), parts per million (ppm), and parts per billion (ppb)

- All methods involve quantifying amount of solute per amount of solvent (or solution).
- Generally amounts or measures are masses, moles or liters.
- Definitions:
mass $\%$ of component $=\frac{\text { mass of component in solution }}{\text { total mass of solution }} \times 100$
ppm of component $=\frac{\text { mass of component in solution }}{\text { total mass of solution }} \times 10^{6}$
ppb of component $=\frac{\text { mass of component in solution }}{\times 10^{9}}$

## Example 1

(a) A solution made by dissolving 13.5 g of glucose in 0.1 kg of water. What's the $\%, \mathrm{ppm}$, and ppb of glucose?
(b) A 2.5 g sample of ground water containing $5.4 \mu \mathrm{~g}$ of $\mathrm{Zn}^{2+}$

## Molarity (M) and Molality (m)

$$
\operatorname{Molarity}(M)=\frac{\text { moles solute }}{\text { liters of solution }}
$$

$$
\operatorname{Molality}(m)=\frac{\text { moles solute }}{\mathrm{kg} \text { of solvent }}
$$

- Converting between molarity $(M)$ and molality $(m)$ requires density.
- kg of solvent $=\mathrm{kg}$ of solution -kg of solute
$=[($ liters of solution $\times$ density $)]-[($ moles solute $) \times($ molecular weight) $\times(0.001)$ ]

## Example 2

(a)Typical seawater contains 2.7 g of salt (sodium chloride, $\mathrm{NaCl})$ per $100 \mathrm{~mL}\left(=100 \times 10^{-3} \mathrm{~L}\right)$. What is the molarity $(\mathrm{M})$ of NaCl in the ocean?

Keys:
What's the \# of moles of NaCl ?
What's the volume (L) and molarity (M)?
(b) $\mathrm{MgCl}_{2}$ has a concentration of 0.054 M in the ocean. How many grams of $\mathrm{MgCl}_{2}$ are present in 25 mL of seawater?

## Example 3

A solution made by dissolving 4.35 g of glucose in 25 mL of water. What's the molality (m) (assume the density of water is $1 \mathrm{~g} / \mathrm{cm}^{3}$ )?

## Example 4

Find the molarity (M) and molality (m) of $37.0 \mathrm{wt} \% \mathrm{HCl}$. The density of a substance is the mass per unit volume. The table inside the back cover of this book tells us that the density of the reagent is $1.19 \mathrm{~g} / \mathrm{mL}$.

## Conversion of $m$ into $M$

What's the Molarity ( $M$ ) of 1.0 Molality ( m ) of NaCl (molecular weight: $58.44 \mathrm{~g} / \mathrm{mol}$ ) water solution (density of solution is 1.05 $\left.\mathrm{g} / \mathrm{cm}^{3}\right)$ ?

## Conversion of $M$ into $m$

What's the Molality (m) of 1.0 Molarity (M) of NaCl (molecular weight: $58.44 \mathrm{~g} / \mathrm{mol}$ ) water solution (density of solution is 1.05 $\mathrm{g} / \mathrm{cm}^{3}$ )?

## How to Prepare 1000 mL of 1 M and 1 m NaCl solution, respectively

What you need?

How to prepare?

## \# of Moles (Amount)

$\operatorname{Molarity}(M)=\frac{\# \text { of moles of solute }}{\text { liters of solution }}$
\# of moles of solute $=($ Molarity $(M))($ liters of solution $(L))$
$\#$ of moles of solute $=\frac{\text { mass of solute }(\mathrm{g})}{M W \text { of solute }(\mathrm{g} / \mathrm{mole})}$
e.g.,
(a) \# of moles and grams of HCl in 100 mL of 0.1 M solution?
(b) \# of moles for 1 g HCl ?

## Dilution 1

\# of moles (amount) in solution does not change before and after dilution.

Simple dilution,
$M_{\text {initial }} \cdot V_{\text {initial }}=M_{\text {final }} \cdot V_{\text {final }}=(\#$ of moles $/ \mathrm{L})(\mathrm{L})=$ \# of moles
e.g., the molarity of "concentrated" HCl purchased for laboratory use is approximately 12.1 M . How many milliliters of this reagent should be diluted to 1.000 L to make 0.100 M HCl ?

## Dilution 2

A solution of ammonia in water is called "ammonium hydroxide" because of the equilibrium

The density of concentrated ammonium hydroxide, which contains 28.0 wt \% NH 3 , is $0.899 \mathrm{~g} / \mathrm{mL}$. What volume of this reagent should be diluted to 500.0 mL to make $0.250 \mathrm{M} \mathrm{NH}_{3}$ ?

1. Molarity of $28.0 \mathrm{wt} \%$ of $\mathrm{NH}_{3}$ ?
2. $M_{\text {initial }} \bullet V_{\text {initial }}=M_{\text {final }} \cdot V_{\text {final }}$

## Chemical Equations \& Stoichiometry

The information from stoichiometry is useful as long as it is balanced

## Balancing

$$
\begin{gathered}
\mathrm{C}_{3} \mathrm{H}_{8}(g)+\mathrm{O}_{2}(g) \rightarrow \mathrm{CO}_{2}(g)+\mathrm{H}_{2} \mathrm{O}(l) \\
\text { Not balanced and how to balance? }
\end{gathered}
$$

## Oxidation and Reduction

$\mathrm{Fe}^{3+}+\mathrm{V}^{2+} \rightarrow \mathrm{Fe}^{2+}+\mathrm{V}^{3+}$

| Oxidizing | Reducing |
| :---: | :---: |
| agent | agent |
| reduced | oxidized |

## Balancing Oxidation-Reduction Reactions (Acidic Condition)

$\mathrm{MnO}_{4}^{-}(a q)+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(a q) \rightarrow \mathrm{Mn}^{2+}(a q)+\mathrm{CO}_{2}(g)$

Two half-reactions are:

1. $\mathrm{MnO}_{4}^{-}(\mathrm{aq}) \rightarrow \mathrm{Mn}^{2+}(\mathrm{aq})$
2. $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(\mathrm{aq}) \rightarrow \mathrm{CO}_{2}(g)$

# How to Balance Oxidation Reaction 

In acidic solution
$\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}+\mathrm{Fe}^{2+} \rightarrow \mathrm{Cr}^{3+}+\mathrm{Fe}^{3+}$
$\mathrm{MnO}_{4}^{-}+\mathrm{Fe}^{2+} \rightarrow \mathrm{Mn}^{2+}+\mathrm{Fe}^{3+}$

In basic solution?

## Revisit pH

$$
\begin{aligned}
& K_{w}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-14} \\
& p H=-\log _{10}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log _{10}\left[\mathrm{H}^{+}\right] \\
& p O H=-\log _{10}\left[\mathrm{OH}^{-}\right] \\
& p H+p O H=14 \\
& {\left[\mathrm{H}^{+}\right]=10^{-p H}} \\
& {\left[\mathrm{OH}^{-}\right]=10^{-p \mathrm{pH}}}
\end{aligned}
$$

## Strong Acids

## (a) pH of 0.05 M of $\mathrm{HClO}_{4}$ ?

(b) pH of 0.0005 M of HCl ?
(c) pH of $0.00000001\left(10^{-8}\right) \mathrm{M} \mathrm{HCl}$ ?

## Strong Bases

(a)What's the pH of 0.05 M of NaOH ?
(b) What's the pH of 0.005 M of $\mathrm{Ca}(\mathrm{OH})_{2}$ ?
(solubility of $\mathrm{Ca}(\mathrm{OH})_{2}=1.73 \mathrm{~g} / \mathrm{L}$ at $20^{\circ} \mathrm{C}$ )
(c) $0.2 \mathrm{M} \mathrm{Ca}(\mathrm{OH})_{2}$ ?

## Weak Acids and Bases

- Weak acids (or bases) are only partially ionized in solution.
- There is a mixture of ions and unionized acid (or base) in solution.
- Therefore, weak acids are in equilibrium:
$\mathrm{HA}(a q) \rightleftharpoons \mathrm{H}^{+}(a q)+\mathrm{A}^{-}(a q)$

$$
K_{a}=\frac{\left[H^{+}\right]\left[A^{-}\right]}{[H A]}
$$

$$
p K_{a}=-\log _{10} K_{a}
$$

$\mathrm{NH}_{3}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{NH}_{4}^{+}(a q)+\mathrm{OH}^{-}(a q)$

$$
K_{b}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}
$$

## pH of $\mathrm{H}_{2} \mathrm{SO}_{4}$

$$
\begin{aligned}
& \text { e.g., } 0.02 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4} \mathrm{pH}=\text { ?, } \\
& \mathrm{H}_{2} \mathrm{SO}_{4} \longrightarrow \mathrm{HSO}_{4}^{-}+\mathrm{H}^{+} \quad \text { (strong acid) } \\
& 0.02 \quad 0.02 \quad 0.02 \\
& \mathrm{HSO}_{4}^{-} \rightleftarrows \mathrm{SO}_{4}{ }^{2-}+\mathrm{H}^{+} \quad \text { (weak acid, } \mathrm{pKa}=1.987 \text { ) } \\
& 0.020 .02 \\
& 0.02-x \quad x \quad 0.02+x \\
& k_{a}=\frac{x \cdot(0.02+x)}{0.02-x}=0.012, x=0.00562 M \\
& {\left[\mathrm{H}^{+}\right]=0.02+0.0562=0.02562} \\
& \mathrm{pH}=-\log (0.02562)=1.59
\end{aligned}
$$

## Conjugate Acids and Bases

- For acetic acid, $\mathrm{CH}_{3} \mathrm{COOH}, K_{a}=1.75 \times 10^{-5}$ weak acid conjugate base
- $\mathrm{CH}_{3} \mathbf{C O O H} \rightleftarrows \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}^{+}$,

$$
K_{a}=\frac{\left[\mathrm{CH}_{3} \mathrm{COO}^{-} \llbracket \mathrm{H}^{+}\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}
$$

- $\mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOH}+\mathrm{OH}^{-}, K_{b}=$ ?

$$
\begin{aligned}
& K_{w}=K_{a} \times K_{b} \\
& p K_{w}=p K_{a}+p K_{b}=14
\end{aligned}
$$

$$
\begin{aligned}
& p X=-\log _{10}[X] \\
& p K_{a}=-\log _{10} K_{a}
\end{aligned}
$$

## Typical Weak-Acid Problem

- What's the pH of 0.01 M acetic acid $\left(\mathrm{CH}_{3} \mathrm{COOH}, K_{a}=1.75 \times 10^{-5}\right)$ ?
- $\mathrm{CH}_{3} \mathrm{COOH} \rightleftarrows \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}^{+}$ before 0.01
0.0
0.0
after
0.01-x
x
x
$K_{a}=\frac{\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\left\lfloor\mathrm{H}^{+}\right]\right.}{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}=\frac{x^{2}}{0.01-x}=1.75 \times 10^{-5}, x=4.1 \times 10^{-4}$
Do not take negative $x$ because concentration can't be negative

## Typical Weak-Acid Problem

- What's the pH of 0.1 M ammonia $\left(\mathrm{NH}_{3}\right)$
- $\mathrm{pK}_{\mathrm{a}}$ of $\mathrm{NH}_{4}{ }^{+}$is $9.244, \mathrm{NH}_{3}$ is conjugate base of $\mathrm{NH}_{4}{ }^{+}$(why?)
- So, $p K_{b}$ of $\mathrm{NH}_{3}=14-9.244=4.756, K_{b}=10^{-4.756}=1.75 \times 10^{-5}$.
- $\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{NH}_{4}{ }^{+}+\mathrm{OH}^{-}$
- $\left[\mathrm{NH}_{4}^{+}\right] \approx\left[\mathrm{OH}^{-}\right]=x,\left[\mathrm{NH}_{3}\right]=0.01-x$

$$
K_{b}=\frac{\left[\mathrm{NH}_{4}^{+} \llbracket \mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}=\frac{x^{2}}{0.1-x}=1.75 \times 10^{-5}, x=1.31 \times 10^{-3}
$$

$$
\mathrm{X}=\left[\mathrm{OH}^{-}\right],\left[\mathrm{H}^{+}\right]=10^{-14} /\left[\mathrm{OH}^{-}\right]=7.61 \times 10^{-12}, \mathrm{pH}=11.12
$$

## pH of Salts

- Identify acid, basic, or neutral first
- Calculate pH of following solutions
- 0.1 M NaCl
- $0.1 \mathrm{M} \mathrm{CH}_{3} \mathrm{COONa}$
- $0.1 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$

## Dissociation of Weak Diprotic Acids and Bases

Diprotic acid
Amphoteric
Diprotic base

Diprotic acid: $\mathrm{H}_{2} \mathrm{CO}_{3} \rightleftarrows \mathrm{HCO}_{3}^{-}+\mathrm{H}^{+}, \quad K_{a 1} \equiv K_{1}$

$$
\mathrm{HCO}_{3}^{-} \rightleftarrows \mathrm{CO}_{3}^{2-}+\mathrm{H}^{+}, \quad K_{\mathrm{a} 2} \equiv K_{2}
$$

Diprotic base: $\mathrm{CO}_{2}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{HCO}_{3}^{-}+\mathrm{OH}^{-}, \quad K_{b 1}$

$$
\mathrm{HCO}_{3}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{H}_{2} \mathrm{CO}_{3}+\mathrm{OH}^{-}, K_{b 2}
$$

Relations between
$K_{a}$ and $K_{b}$ :

$$
K_{\mathrm{a} 1} \cdot K_{\mathrm{b} 2}=K_{\mathrm{w}} \quad K_{\mathrm{a} 2} \cdot K_{\mathrm{b} 1}=K_{\mathrm{w}}
$$

## Mass Balance

- When electrolytes (including acids and bases) are dissolved in water, their total amount should preserved after dissociation.
- If you add $\mathrm{H}_{3} \mathrm{PO}_{4}$ in water, $\mathrm{H}_{3} \mathrm{PO} 4$ will be present one of the following forms, $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}, \mathrm{HPO}_{4}{ }^{2-}, \mathrm{PO}_{4}{ }^{3-}$, and plus $\mathrm{H}_{3} \mathrm{PO} 4$ (undissociated form).
- Total Initial $\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]=\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]+\left[\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}\right]+\left[\mathrm{HPO}_{4}{ }^{2-}\right]+$ $\left[\mathrm{PO}_{4}{ }^{3-}\right]$

Undissociated because it is weak acid

## Charge Balance

- When electrolytes (including acids and bases) are dissolved in water, solution should be electrically neutral. This means that total charge of cations is identical to that of anions.
- If you add KOH and $\mathrm{H}_{3} \mathrm{PO}_{4}$ in water, there are $\mathrm{K}^{+}, \mathrm{OH}^{-}$, $\mathrm{H}^{+}, \mathrm{H}_{2} \mathrm{PO}_{4}^{-}, \mathrm{HPO}_{4}{ }^{2-}$, and $\mathrm{PO}_{4}{ }^{3-}$ in solution.
- Total positive charge $=\left[\mathrm{K}^{+}\right]+\left[\mathrm{H}^{+}\right]$
- Total negative charge $=\left[\mathrm{OH}^{-}\right]+$ $\left[\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}\right]+2\left[\mathrm{HPO}_{4}{ }^{2-}\right]+3\left[\mathrm{PO}_{4}{ }^{3-}\right]$

## pH of Diprotic Acids, Salts, \& Bases

1. $\mathrm{H}_{2} \mathrm{~A}$ is treated as a monoprotic weak acid, with $K_{\mathrm{a}}=K_{1}$.

$$
K_{a}=\frac{x^{2}}{0.01-x}, x=\left[H^{+}\right]
$$

e.g., pH of $0.1 \mathrm{M} \mathrm{H}_{2} \mathrm{CO}_{3}$ ?, $\mathrm{K}_{1}=4.46 \times 10^{-7}, \mathrm{~K}_{2}=4.69 \times 10^{-11}$
2. $\mathrm{A}^{2-}$ is treated as monobasic, with $K_{\mathrm{b}}=K_{\mathrm{b} 1}=K_{\mathrm{w}} / K_{2}$.

$$
K_{b}=\frac{x^{2}}{0.01-x}, x=\left[O H^{-}\right]
$$

$$
\text { e.g., } \mathrm{pH} \text { of } 0.1 \mathrm{M} \mathrm{Na}_{2} \mathrm{CO}_{3} ? \mathrm{~K}_{1}=4.46 \times 10^{-7}, \mathrm{~K}_{2}=4.69 \times 10^{-11}
$$

## pH of Diprotic Acids and Bases (continued)

3. $\mathrm{HA}^{-}$is treated as the intermediate form of a diprotic acid ( F ; formal concentration of $\mathrm{HA}^{-}$)

$$
\left[H^{+}\right] \approx \sqrt{\frac{K_{l} K_{2} F+K_{l} K_{w}}{K_{l}+F}}
$$

How? Prove it by charge and mass balance
e.g., pH of $0.1 \mathrm{M} \mathrm{NaHCO}_{3}$ ? $\mathrm{K}_{1}=4.46 \times 10^{-7}, \mathrm{~K}_{2}=4.69 \times 10^{-11}$

## $\mathrm{p} K_{\mathrm{a}}$ vs. pH

$\mathrm{HX}(a q) \rightleftharpoons \mathrm{H}^{+}(a q)+\mathrm{X}^{-}(a q)$

$$
\begin{aligned}
& K_{a}=\frac{\left[H^{+}\right]\left[X^{-}\right]}{[H X]}, \text { then }\left[H^{+}\right]=K_{a} \frac{[H X]}{\left[X^{-}\right]} \\
& -\log \left[H^{+}\right]=-\log K_{a}-\log \frac{[H X]}{\left[X^{-}\right]}
\end{aligned}
$$

$\therefore p H=p K_{a}+\log \frac{\left[X^{-}\right]}{[H X]}$
$\therefore p H=p K_{a}$, if $[H X]=\left[X^{-}\right]$

- $\mathrm{pK}_{\mathrm{a}}$ is the pH where $50 \%$ of acids is deprotonated.
- If $\mathrm{pH}>\mathrm{pK}_{\mathrm{a}}$, more than $50 \%$ of acids are deprotonated
- If $\mathrm{pH}<\mathrm{pK}_{\mathrm{a}}$, less than $50 \%$ of acids are deprotonated

## pH Effect on Net Charge

Glycine

$$
\begin{array}{ll}
+2, & \mathrm{pH}<2.2 \\
+1, & 2.2<\mathrm{pH}<9.0 \\
0, & 9.0<\mathrm{pH}<10.5 \\
-1, & 10.5<\mathrm{pH}
\end{array}
$$

Lysine

Suprofen

$$
p K_{a}=3.9
$$

composition at $\mathrm{pH}=7.2$ ?
amphetamine

## Buffered Solutions

- A buffer consists of a mixture of a weak acid (HA) and its conjugate base ( $\mathrm{A}^{-}$) (or weak base and conjugate acid):
- The $K_{a}$ expression is

$$
\mathrm{HA}(a q) \rightleftharpoons \mathrm{H}^{+}(a q)+\mathrm{A}^{-}(a q)
$$

$$
\begin{aligned}
& K_{a}=\frac{\left[H^{+}\right]\left[A^{-}\right]}{[H A]} \\
& \therefore\left[H^{+}\right]=K_{a} \frac{[H A]}{\left[A^{-}\right]}
\end{aligned}
$$

- A buffer resists a change in pH when a small amount of $\mathrm{OH}^{-}$or $\mathrm{H}^{+}$is added.

## Henderson-Hasselbalch Equation

$$
\mathrm{HA}(a q) \rightleftharpoons \mathrm{H}^{+}(a q)+\mathrm{A}^{-}(a q)
$$

$$
\begin{aligned}
& K_{a}=\frac{\left[H^{+}\right]\left[A^{-}\right]}{[H A]} \\
& \therefore\left[H^{+}\right]=K_{a} \frac{[H A]}{\left[A^{-}\right]}
\end{aligned}
$$

$$
\begin{aligned}
& -\log \left[H^{+}\right]=-\log K_{a}-\log \frac{[H A]}{\left[A^{-}\right]} \\
& \therefore p H=p K_{a}+\log \frac{\left[A^{-}\right]}{[H A]}
\end{aligned}
$$

If we know $\left[A^{-}\right]$and $[H A]$, and $K_{a}$, then we can calculate pH of buffer

## Example 5

What's the pH of a buffer that is 0.12 M in lactic acid $\left(\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{3}\right)$ and 0.1 M in sodium lactate? For lactic acid, $K_{a}=$ $1.4 \times 10^{-4}$.
$p H=p K_{a}+\log \frac{\left[A^{-}\right]}{[H A]}$

## Example 6

A buffer is made by adding $0.3 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{COOH}$ and 0.3 mol $\mathrm{CH}_{3} \mathrm{COONa}$ to enough water to make 1.0 L of solution. For $\mathrm{CH}_{3} \mathrm{COOH}, K_{a}=1.8 \times 10^{-5}$.
(a) what's the pH of this buffer?
(b) what's the pH after 0.02 mole of NaOH is added?
(c) what's the pH after 0.02 mole of HCl is added?

## Strong Acid- Strong Base Titration

```
HCl (analyte) + NaOH (titrant) }\longrightarrow\textrm{NaCl}(\mathrm{ salt) + + + \(0.02 \mathrm{M}, 50 \mathrm{~mL} \quad 0.1 \mathrm{M}\)
```

1: Before equivalence point: 9.50 mL of 0.1 M NaOH was added
Step 1: \# of mole of HCl and \# of mole of NaOH before reaction Step 2: \# of mole of HCl after reaction
Step 3: $[\mathrm{HCl}]$
Step 4: $\left[\mathrm{H}^{+}\right]$
Step 5: pH
2. At the equivalence point: 10.00 mL of 0.1 M NaOH was added
3. After equivalence point: 10.50 mL of 0.1 M NaOH was added

## Strong Acid-Base Titration

## Weak Acid- Strong Base Titration

$$
0.02 \mathrm{M}, 50 \mathrm{~mL} \quad 0.1 \mathrm{M}, x \mathrm{~mL}
$$

1. Before base is added, it is a solution of weak acid ( pH can be found from $K_{a}$ )
2. Before equivalence point: 3.0 mL of 0.1 M NaOH was added It is a buffer solution containing weak acid (HA) and its conjugate base ( $\mathrm{A}^{-}$)

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}
$$

3. At the equivalence point: 10 mL of 0.1 M NaOH was added Only conjugate base exists ( $\mathrm{pH}>7$, can be calculated from $K_{b}$ or $K_{a}$ )
4. After equivalence point: 10.10 mL of 0.1 M NaOH was added Two bases are exist, NaOH and $\mathrm{A}^{-}$, we can calculate pH

## Weak Acid- Strong Base Titration

## Diprotic Acid- Strong Base Titration

$\mathrm{H}_{2} \mathrm{~A}$ (analyte) +2 NaOH (titrant) $\longrightarrow \mathrm{Na}_{2} \mathrm{~A}$ (salt) $+2 \mathrm{H}_{2} \mathrm{O}$
$0.1 \mathrm{M}, 20 \mathrm{~mL} \quad 0.1 \mathrm{M}$
$\mathrm{K}_{1}=1.4 \times 10^{-2}, \mathrm{~K}_{2}=6.5 \times 10^{-8}$
1: Before equivalence point: 19 mL of 0.1 M NaOH was added $\mathrm{H}_{2} \mathrm{~A}$ (analyte) +NaOH (titrant) $\longrightarrow \mathrm{NaHA}$ (salt) $+\mathrm{H}_{2} \mathrm{O}$

Step 1: \# of mole of $\mathrm{H}_{2} \mathrm{~A}$ and \# of mole of NaOH before reaction Step 2: \# of mole of $\mathrm{H}_{2} \mathrm{~A}$ after reaction
Step 3: $\left[\mathrm{H}_{2} \mathrm{~A}\right]$
Step 4: $\left[\mathrm{H}^{+}\right]$
Step 5: pH
2. At the $1^{\text {st }}$ equivalence point: 20.00 mL of 0.1 M NaOH was added
3. After $1^{\text {st }}$ equivalence point: 30 mL of 0.1 M NaOH was added NaHA (analyte) +NaOH (titrant) $\longrightarrow \mathrm{Na}_{2} \mathrm{~A}$ (salt) $+\mathrm{H}_{2} \mathrm{O}$
4. At the $2^{\text {nd }}$ equivalence point: 40.00 mL of 0.1 M NaOH was added
5. After the 2nd equivalence point: 50.00 mL of 0.1 M NaOH was added

## Titration Curve

## Chemistry of Indicators

Phenolphthalein $\mathrm{pH}<8.0 \square \mathrm{pH}>9.6$

Color change why?

## Significant Figures

$9.25 \times 10^{4}$<br>$9.250 \times 10^{4}$<br>$9.2500 \times 10^{4}$

3 significant figures
4 significant figures
5 significant figures
0.0050 two significant figures 0.00500 three significant figures

The last significant figure has always uncertainty

## What's your reading?

Percent transmittance

Absorbance

## 58.2 or 58.3 or 58.4 ... ...

The last significant figure has always uncertainty ${ }^{55}$

## Addition and subtraction

$100000000000000000+0.000001=100000000000000000.000001$
Is this meaningful? answer is no

Now, $100000000000000000+0.000001=?$

## Multiplication and division

In multiplication and division, we are normally limited to the number of digits contained in the number with the fewest significant figures

## Gaussian distribution

## Example 7

Find the average and the standard deviation for $821,783,834$, and 855.
$\bar{x}=\frac{821+783+834+855}{4}=823_{\cdot 2}$
$s=\sqrt{\frac{(821-823.2)^{2}+(783-823.2)^{2}+(834-823.2)^{2}+(855-823.2)^{2}}{(4-1)}}$
$=30 \cdot 3$
$823.2 \pm 30.3 \longrightarrow$ good for continued calculation $\left.\begin{array}{l}823 \pm 30 \\ 820 \pm 30\end{array}\right] \longrightarrow$ good for final calculation

## Confidence interval

The confidence interval is an expression stating that the true mean, $\mu$, is likely to lie within a certain distance from the measured mean, $\bar{x}$.

$$
\boldsymbol{\mu}=\bar{x} \pm \frac{t s}{\sqrt{n}}
$$

$s$ : measured standard deviation
$n$ : \# of measurements
$t$. student's $t$ value (see table in the next page)

Table 4-2 Values of Student's $t$

| $\begin{aligned} & (n-1) \\ & \text { Degrees of freedom } \end{aligned}$ | Confidence level (\%) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 50 | 90 | 95 | 98 | 99 | 99.5 | 99.9 |
| 1 | 1.000 | 6.314 | 12.706 | 31.821 | 63.657 | 127.32 | 636.619 |
| 2 | 0.816 | 2.920 | 4.303 | 6.965 | 9.925 | 14.089 | 31.598 |
| 3 | 0.765 | 2.353 | 3.182 | 4.541 | 5.841 | 7.453 | 12.924 |
| 4 | 0.741 | 2.132 | 2.776 | 3.747 | 4.604 | 5.598 | 8.610 |
| 5 | 0.727 | 2.015 | 2.571 | 3.365 | 4.032 | 4.773 | 6.869 |
| 6 | 0.718 | 1.943 | 2.447 | 3.143 | 3.707 | 4.317 | 5.959 |
| 7 | 0.711 | 1.895 | 2.365 | 2.998 | 3.500 | 4.029 | 5.408 |
| 8 | 0.706 | 1.860 | 2.306 | 2.896 | 3.355 | 3.832 | 5.041 |
| 9 | 0.703 | 1.833 | 2.262 | 2.821 | 3.250 | 3.690 | 4.781 |
| 10 | 0.700 | 1.812 | 2.228 | 2.764 | 3.169 | 3.581 | 4.587 |
| 15 | 0.691 | 1.753 | 2.131 | 2.602 | 2.947 | 3.252 | 4.073 |
| 20 | 0.687 | 1.725 | 2.086 | 2.528 | 2.845 | 3.153 | 3.850 |
| 25 | 0.684 | 1.708 | 2.060 | 2.485 | 2.787 | 3.078 | 3.725 |
| 30 | 0.683 | 1.697 | 2.042 | 2.457 | 2.750 | 3.030 | 3.646 |
| 40 | 0.681 | 1.684 | 2.021 | 2.423 | 2.704 | 2.971 | 3.551 |
| 60 | 0.679 | 1.671 | 2.000 | 2.390 | 2.660 | 2.915 | 3.460 |
| 120 | 0.677 | 1.658 | 1.980 | 2.358 | 2.617 | 2.860 | 3.373 |
| $\infty$ | 0.674 | 1.645 | 1.960 | 2.326 | 2.576 | 2.807 | 3.291 |

NOTE: In calculating confidence intervals, $\sigma$ may be substituted for $s$ in Equation 4-6 if you have a great deal of experience with a particular method and have therefore determined its "true" population standard deviation. If $\sigma$ is used instead of $s$, the value of $t$ to use in Equation 4-6 comes from the bottom row of Table 4-2.

## Example 8

The carbohydrate content of a glycoprotein (a protein with sugars attached to it) is determined to be $12.6,11.9,13.0,12.7$, and 12.5 g of carbohydrate per 100 g of protein in replicate analyses. Find the $50 \%$ and $90 \%$ confidence intervals for the carbohydrate content.

$$
\bar{x}=12.54, s=0.40
$$

50 \% confidence interval,

$$
\boldsymbol{\mu}=\bar{x} \pm \frac{t s}{\sqrt{n}}=12.5_{4} \pm \frac{(0.741)\left(0.4_{0}\right)}{\sqrt{5}}=12.5_{4} \pm 0.1_{3}
$$

90 \% confidence interval,

$$
\mu=\bar{x} \pm \frac{t s}{\sqrt{n}}=12.5_{4} \pm \frac{(2.132)\left(0.4_{0}\right)}{\sqrt{5}}=12.5_{4} \pm 0.3_{8}
$$

## Confidence interval vs. $n$

$50 \%$ confidence interval is narrower than $90 \%$ confidence interval

Confidence interval becomes narrower by more measurements

## What does it mean by confidence interval?

$50 \%$ of confidence interval will include true mean

$90 \%$ of confidence interval will include true mean

## t-Test

A $t$ test can be used to compare one set of measurements with another to decide whether or not they are the same.

Three different cases,

Case 1: Comparing measure results with a "known" value

Case 2: Comparing replicate measurements
Case 3: Comparing individual difference

## Case 1: Comparing measure results with a "known" value

You purchased a Standard Reference Material coal sample certified by NIST to contain 3.19 wt \% sulfur. You are testing a new analytical method to see whether it can reproduce the known value. The measured values are 3.29, 3.22, 3.30, and $3.23 \mathrm{wt} \%$ sulfur, giving a mean of $\bar{x}=3.26_{0}$ and a standard deviation of $s=0.04_{1}$. Does your answer agree with the known answer?

To find out, compute $\mathrm{t}_{\text {calculated }}$ and compare it with $t_{\text {table }}$ in Table 4-2. If $t_{\text {calculated }}$ is greater than $t_{\text {table }}$ at the $95 \%$ confidence level, the two results are considered to be different.

$$
t_{\text {calculated }}=\frac{\mid \bar{x}-\text { known value } \mid}{s} \sqrt{n}
$$

$$
t_{\text {calculated }}=\frac{\left|3.26_{0}-3.19\right|}{0.04_{1}} \sqrt{4}=3.41
$$

Result is different from the known value. The chance that you made

$$
t_{\text {calculated }}(=3.41)>t_{\text {table }}(=3.182)
$$ a mistake when concluding that they are different is $5 \%$.

# Case 2: Comparing replicate measurements 

Table 4-3 Masses of gas isolated by Lord Rayleigh

## Are they same?

source: R. D. Larsen, J. Chem. Ed. 1990, 67, 925; see also C. J. Giunta, J. Chem. Ed. 1998, 75, 1322.

$$
\begin{aligned}
& t_{\text {calculated }}=\frac{\left|\bar{x}_{1}-\bar{x}_{2}\right|}{s_{\text {pooled }}} \sqrt{\frac{n_{1} n_{2}}{n_{1}+n_{2}}} \\
& s_{\text {pooled }}=\sqrt{\frac{\sum_{\text {set } 1}\left(x_{i}-\bar{x}_{1}\right)^{2}+\sum_{\text {set } 2}\left(x_{j}-\bar{x}_{2}\right)^{2}}{n_{1}+n_{2}-2}}=\sqrt{\frac{s_{1}^{2}\left(n_{1}-1\right)+s_{2}^{2}\left(n_{2}-1\right)}{n_{1}+n_{2}-2}} \\
& x_{1}=2.31011 \mathrm{~g}, s_{1}=0.00014_{3}, n_{1}=7 \text { measurements } \\
& x_{2}=2.29947 \mathrm{~g}, s_{2}=0.00138, n_{2}=8 \text { measurements } \\
& s_{\text {pooled }}=\sqrt{\frac{0.00014_{3}^{2}(7-1)+0.00138^{2}(8-1)}{7+8-2}}=0.00102 \\
& t_{\text {calculated }}=\frac{|2.31011-2.29947|}{0.00102} \sqrt{\frac{7 \cdot 8}{7+8}}=20.2 \\
& \text { For } 13 \text { (7 + }+2 \text {-2) degrees of freedom in Table 4-2, } t_{\text {table }} \\
& \text { for lies between } 95 \% \text { confidence. Because } t_{\text {calculated }} \gg t_{\text {table }} \text {, the difference is significant. In fact, } \\
& t_{\text {table }} \text { for } 99.9 \% \text { confidence is } \sim 4.3 \text {. The difference is significant beyond the } 99.9 \% \\
& \text { confidence level. }
\end{aligned}
$$

## Case 3: Comparing Individual Difference

Table 4-4 Comparison of two methods for measuring cholesterol

|  | Cholesterol content $(\mathrm{g} / \mathbf{L})$ |  |  |
| :--- | :--- | :---: | :---: |
| Plasma sample <br> $\left(\boldsymbol{d}_{\boldsymbol{i}}\right)$ | Method A | Method B | Difference |
| 1 | 1.46 | 1.42 | 0.04 |
| 2 | 2.22 | 2.38 | -0.16 |
| 3 | 2.84 | 2.67 | 0.17 |
| 4 | 1.97 | 1.80 | 0.17 |
| 5 | 1.13 | 1.09 | 0.04 |
| 6 | 2.35 | 2.25 | 0.10 |

Is method $\mathbf{B}$ systematically different from method $\mathbf{A}$ ?

$$
t_{\text {calculated }}=\frac{\bar{d}}{s_{d}} \sqrt{n} \quad s_{d}=\sqrt{\frac{\sum\left(d_{i}-\bar{d}\right)^{2}}{n-1}}
$$

The quantity $\bar{d}$ is the average difference between methods A and B , and $n$ is the number of pairs of data (six in this case).

$$
\begin{aligned}
& s_{\mathrm{d}}=\sqrt{\frac{(0.04-\bar{d})^{2}+(-0.16-\bar{d})^{2}+(0.17-\bar{d})^{2}+(0.17-\bar{d})^{2}+(0.04-\bar{d})^{2}+(0.10-\bar{d})^{2}}{6-1}} \\
& \quad=0.12_{2}\left(\text { using } \bar{d}=0.06_{0}\right) \\
& t_{\text {calculated }}=\frac{0.06_{0}}{0.12_{2}} \sqrt{6}=1.20
\end{aligned}
$$

We find that $t_{\text {calculated }}$ (1.20) is less than $t_{\text {table }}(2.571)$ listed in Table 4-2 for $95 \%$ confidence and 5 degrees of freedom. The two techniques are not significantly different at the $95 \%$ confidence level.

## Q test for bad data

The $\boldsymbol{Q}$ test helps decide whether to retain or disregard a questionable data.

If $Q_{\text {calculated }}>Q_{\text {table }}$, the questionable point should be discarded. For the numbers above, $Q_{\text {calculated }}=0.11 / 0.20=0.55$. In Table 4-6, we find $Q_{\text {table }}=$ 0.64. Because $Q_{\text {calculated }}<Q_{\text {table }}$, the questionable point should be retained. There is more than a $10 \%$ chance that the value 12.67 is a member of the same population as the other four numbers.
