## Lecture 5

## Resolution and Numerical Aperture

## Resolution

## Smallest distance between two points that can be distinguished

Airy Patterns and the Limit of Resolution

## Fine Detail Acts As a Diffraction Grating

Visible light induces diffraction if two points are close

$w=0.16 \mathrm{~mm}$
$w=0.08 \mathrm{~mm}$
$w=0.04 \mathrm{~mm}$

## Diffraction vs Resolution

Spacing resolved: we can see the separation of two spots

## Diffraction vs Resolution

Space not resolved: you can collect only one of the rays from the diffraction pattern

## Resolution

Resolution $(x)=\left(0.61^{*} \lambda\right) /(N A)$
Numerical Aperture (NA)
$N A=\mathbf{n}^{*} \sin (\mathbf{A} / 2)$
where $\mathbf{n}$ is the index of refraction of the medium in which the lens is working, and $\mathbf{A}$ is the angular aperture of the lens

Figure 1

Resolution depends on wavelength, $n$, and A (distance)

## Resolution: Wavelength

Blue $(400 \mathrm{~nm})$ is better than red ( 650 nm )

| Wavelength <br> (Nanometers) | Resolution <br> (Micrometers) |
| :---: | :---: |
| 360 | .19 |
| 400 | .21 |
| 450 | .24 |
| 500 | .26 |
| 550 | .29 |
| 600 | .32 |
| 650 | .34 |
| 700 | .37 |

## Resolution: NA

Low value for angular
Aperture A ( $\alpha$ )
Low numerical aperture (NA) Large X
Low resolution

High value for angular Aperture, A ( $\alpha$ )
High numerical aperture (NA) Small X
High resolution

## Resolution: Objectives

## Resolution: n

$i=1.0$
32 angle
$N A=0.6$

$i=1.515$
58 angle
NA. $=1.3$

## Resolution

## Objective Type

|  | Plan Achromat |  | Plan Fluorite |  | Plan Apochromat |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Magnificati <br> on | N.A. | Resolution <br> $(\mu \mathrm{m})$ | N.A. | Resolution <br> $(\mu \mathrm{m})$ | N.A. | Resolution <br> $(\mu \mathrm{m})$ |
| 4 x | 0.10 | 2.75 | 0.13 | 2.12 | 0.20 | 1.375 |
| 10 x | 0.25 | 1.10 | 0.30 | 0.92 | 0.45 | 0.61 |
| 20 x | 0.40 | 0.69 | 0.50 | 0.55 | 0.75 | 0.37 |
| 40 x | 0.65 | 0.42 | 0.75 | 0.37 | 0.95 | 0.29 |
| 60 x | 0.75 | 0.37 | 0.85 | 0.32 | 0.95 | 0.29 |
| 100x | 1.25 | 0.22 | 1.30 | 0.21 | 1.40 | 0.20 |
| N.A. $=$ Numerical Aperture |  |  |  |  |  |  |

## Objective Lens

## Lecture 6

Micrometry

## Micrometry

## Measurement through microscope

Millimeter, $\mu \mathrm{m}$ (micron)
Eyepieces with reticles are required

## Stage Micrometer for Calibration

1 division $=0.01 \mathrm{~mm}(10 \mu \mathrm{~m})$
Total 100 divisions $100^{*} 0.01=1 \mathrm{~mm}$

## Calibration 1 (Demo Required)

$$
(25 / 97)^{*} 10=2.58 \mu \mathrm{~m}
$$

## Calibration 2

left right
OS (ocular scale) SS (stage scale)

27
1070
\# of divisions 38 60

$$
(60 / 38)^{*} 10=15.8 \mu \mathrm{~m}
$$

## SS

## left right <br> 95 <br> SS (stage scale) <br> 0 <br> 0100 <br> \# of divisions 95 <br> 100

$$
(100 / 95)^{*} 10=10.5 \mu \mathrm{~m}
$$

## What's the Size?

## Various Statistical Diameter

## Martin's Diameter

Martin's diameter:

- The simplest means of measuring for irregular particles
- Sufficiently accurate when averaged for a large number of particles

## Particle Size Distribution

## Thickness Measurements

## Thokness Determination

1. Top surface is sharply focused (left)
2. Micrometer reading (0)
3. Bottom (edge) was focused
4. Micrometer reading (3)
5. Difference $=3-0=3$
6. One reading $=3 \mu \mathrm{~m}$
7. (depends on manufacture)
8. Thickness $\approx 9 \mu \mathrm{~m}$

## Exercise 3

1. Precisely measure the size of one division in X10 and X40 objectives
2. Choose four samples (two from group A and two from group B) and measure sample sizes (or thicknesses) and height at three different places (or particles) using either X10 or X40 objectives

A division of fine adjusting knob in your microscope is $3 \mu \mathrm{~m}$.

## Lecture 7

## Crystal Morphology

## Crystalline and Noncrystalline

Two dimensional representation

## Degrees of Crystallinity

-     -         -             - 
-     -         -             -                 - 
-     -         -             -                 - 

-     -         -             -

diamond

## Crystal Structure

- Unit cell
- The arrangement of unit cell in space

A Crystalline Solid Can Be Constructed From A "Unit Cell" Plus Translational Operators

Unit Cell

Translation along y axis

Translation along $x$ axis

## Polymorphism 1

- The ability of a solid material to exist in more than one form or crystal structure.
- Same building block, but different 3-dimensional arrangements

-     -         -             - 

## Polymorphism 2

- Same building block, but different 3-dimensional arrangements
- Different macroscopic shapes

## Symmetry Element

Rotation: 2, 3, 4, 6
Center Plan

## Unit Cell and Crystal Parameters

Crystals are characterized by repeating units. This repeating unit is called the unit cell.

## Six Crystal Systems

ORTHORHOMBIC
MONOCLINIC
TRICLINIC

## Six Crystal Systems

Crystal System
Cubic
Hexagonal
Tetragonal
Orthorhombic
Monoclinic
Triclinic

Edge lengths and angles (parameters)

$$
\begin{gathered}
a=b=c ; \alpha=\beta=\gamma=90^{\circ} \\
a=b, c ; \alpha=\beta=90^{\circ}, \gamma=120^{\circ} \\
a=b, c ; \alpha=\beta=\gamma=90^{\circ} \\
a, b, c ; \alpha=\beta=\gamma=90^{\circ}
\end{gathered}
$$

$\mathrm{a}, \mathrm{b}, \mathrm{c} ; \alpha=\gamma=90^{\circ} ; \beta$ not equal to $90^{\circ}$
a, $\mathrm{b}, \mathrm{c} ; \alpha$ not equal to $\beta$ not equal to $\gamma$ not equal to $90^{\circ}$

## Crystal Forms: (Pinacoids)

cubic

orthorhombic

tetragonal

monoclinic

hexagonal

triclinic

## Cubic System

## Isometric System

Cube

Octahedron

Dodecahedron

## Shading Helps Determine Form

plan

elevation

## Measurement of Profile Angles

## Orientation

## Crystal Habit 1

crystal structure
observed crystal forms

## Crystal Habit 2

table
equant or massive
plate or flake

## Twin Crystals
